

Web and UI Design

Lab Seven

Create an HTML file called index.html and a CSS file called style.css: all style properties can be split between external embedded and inline styling as you like. Background color, as well as any styling not mentioned in this spec is up to yourself

Your HTML page should have the following:

An HTML container

A Head container

- A comment with your student Id, your full name and the date
- A title element containing the file name
- A stylesheet link to a style.css
- Viewport Meta tag

A body container

- A heading 1 with
 - id "welcome"
 - text "Hello"
 - Black font
 - Font size 10px
- A text input control that replaces the text in "welcome" with its value when its input changes
- A color input control that changes the "welcome" font color on input.
- A button called "Increase size" that changes "welcome" font size to 100px
- A button called "Decrease size" that changes "welcome" font size to 20px
- An embedded script tag.

Upload index.html and style.css

Example page layout

Your page layout, once loaded in the Browser, should appear similar (but not exactly same) as the one shown below.
