

Part A - Queue

1. Create a Song class, each song has the following attributes: songTitle of type string and duration in seconds of type integer.
2. Using the STL queue container, create a main programme that manages a music playlist. Users can add songs to the playlist and songs are played in FIFO order. Your program should show in the correct order the titles of the songs playing, and their duration.

Part B – Stack.

3. Write a main program that uses the STL: Stack and takes as input a string from the user and uses the stack to write it backwards on the screen.
