

Do not use code from the STL, make sure to reference all the sources you used to solve the problem.

Here is code from the internet to implement your own vector class from the website geeksforgeeks.

<https://www.geeksforgeeks.org/how-to-implement-our-own-vector-class-in-c/>

This code is poor and if submitted by a student (assuming they wrote it themselves) could get awarded less than 30 marks out of 100. Why?

**Code Task 1:** Edit and fix the code to make it a passing standard. Hint: You must separate class declaration from definition. You do not have to upload any code.

**Discussion Task 1:** For this task you will submit a short video (5 mins max).

For this video you will need to screen capture as you must show where in the geeksforgeek code the bad practice is present, and you must explain it your dialogue.

**Note:** The max upload 50MB so as I cannot receive .zip or large attachments by email you may need to use a free video compression program to make your video smaller for Moodle upload. For example, “any video converter” <https://www.any-video-converter.com/products/video-converter-free/>
