

Code Task: Submit the .cpp files to solve the task below, make sure to reference all the sources you used to solve the problem.

Write a program that converts from 24-hour notation to 12-hour notation, and vis versa. For

example, it should convert 14:25 to 2:25 P.M. and 3:40 P.M. to 15:40.

There should be at least four functions: one for user input, one to do the 12-hour conversion, one to do the 24-hour conversion, and one for output to the screen. There should be no global variables in your program, so you will need to use pass-by-reference function parameters.

Record the A.M./P.M. information determined by the conversion functions as a value of type char, 'A' for A.M. and 'P' for P.M. The functions for doing the conversion should return false if the integers passed to it do not correspond to a valid clock time.

Write a main programme to test all your functions. In your main Include a loop that lets the user repeat this computation for new input values again and again until the user says he or she wants to end the program.

The Good news!

To get started watch the video here:

<https://www.youtube.com/watch?v=RKwJh5IPe40>

And have a look at the code at the following websites

<https://www.codespeedy.com/convert-24-hour-format-to-12-hour-format-using-cpp/>

<https://www.geeksforgeeks.org/program-convert-time-12-hour-24-hour-format/>

<https://www.geeksforgeeks.org/convert-time-from-24-hour-clock-to-12-hour-clock-format/>

The Bad News! (0 marks warning).

All your functions that take parameters should use pass by reference (if the argument should not change in the function use const), and you should have no global variables.
